

A Vector and Tensor Analysis in Turbomachinery Fluid Mechanics

A. 1 Tensors in Three-Dimensional Euclidean Space

In this section, we briefly introduce tensors, their significance to turbomachinery fluid dynamics and their applications. The tensor analysis is a powerful tool that enables the reader to study and to understand more effectively the fundamentals of fluid mechanics. Once the basics of tensor analysis are understood, the reader will be able to derive all conservation laws of fluid mechanics without memorizing any single equation. In this section, we focus on the tensor analytical application rather than mathematical details and proofs that are not primarily relevant to engineering students. To avoid unnecessary repetition, we present the definition of tensors from a unified point of view and use exclusively the three-dimensional Euclidean space, with $N = 3$ as the number of dimensions. The material presented in this chapter has drawn from classical tensor and vector analysis texts, among others those mentioned in References. It is tailored to specific needs of turbomachinery fluid mechanics and is considered to be helpful for readers with limited knowledge of tensor analysis.

The quantities encountered in fluid dynamics are *tensors*. A physical quantity which has a *definite magnitude* but not a *definite direction* exhibits a *zeroth-order tensor*, which is a special category of tensors. In a N -dimensional Euclidean space, a zeroth-order tensor has $N^0 = 1$ component, which is basically its magnitude. In physical sciences, this category of tensors is well known as a *scalar* quantity, which has a definite magnitude but not a definite direction. Examples are: mass m , volume v , thermal energy Q (heat), mechanical energy W (work) and the entire thermo-fluid dynamic properties such as density ρ , temperature T , enthalpy h , entropy s , etc.

In contrast to the zeroth-order tensor, a *first-order tensor* encompasses physical quantities with a *definite magnitude* with N^1 ($N^1 = 3^1 = 3$) components and a *definite direction* that can be decomposed in $N^1 = 3$ directions. This special category of tensors is known as *vector*. Distance X , velocity V , acceleration A , force F and moment of momentum M are few examples. A vector quantity is *invariant* with respect to a given category of coordinate systems. Changing the coordinate system by applying certain transformation rules, the vector components undergo certain changes resulting in a new set of components that are related, in a definite way, to the old ones. As we will see later, the order of the above tensors can be reduced if they are multiplied with each other in a *scalar* manner. The mechanical energy
