

Diagram of the human eye showing internal structures.

The eye is a complex organ that allows us to see. It is made up of several parts, including the cornea, lens, and retina. The cornea is the front part of the eye that helps to focus light. The lens is a small, clear structure that can change shape to focus light on the retina. The retina is the back part of the eye that contains light-sensitive cells called rods and cones. These cells send signals to the brain, which interprets them as images.

There are also several muscles in the eye that help to move it and focus light. The iris is a colored part of the eye that controls the size of the pupil. The pupil is the opening in the center of the iris that allows light to enter the eye. The ciliary muscles are located behind the lens and help to change its shape. The suspensory ligaments are fibers that hold the lens in place and help to change its shape.
