The SPARC Architecture Manual SPARC International, 1992 This in depth guide to Version 8 SPARC a high speed RISC computer chip provides the reader with the background design philosophy high level features and implementations of this new model Includes an expanded index of terms for easy reference and a table of synthetic instructions added to the suggested assembly language syntax

The SPARC Architecture Manual SPARC International, 1994 SPARC Scalable Processor Architecture is the industry s only openly defined and evolved RISC architecture Version 9 is the new 64 bit incarnation of SPARC the most significant change since SPARC s introduction in 1987 Unlike other RISC Reduced Instruction Set Computer designs SPARC specifies not a hardware implementation chip but an open standard architecture belonging to the community of SPARC vendors and users The SPARC specification is defined by the SPARC Architecture Committee a technical arm of the computer maker consortium SPARC International Version 9 provides 64 bit data and addressing support for fault tolerance fast context switching support for advanced compiler optimizations efficient design for Superscalar processors and a clean structure for modern operating systems The V9 architecture supplements rather than replaces the 32 bit Version 8 architecture The non privileged features of Version 9 are upward compatible from Version 8 so 32 bit application software can execute natively without modification on Version 9 systems no special compatibility mode is required Publication of the Version 9 architecture marks a three year development effort by SPARC International member companies from a broad cross section of disciplines

circuits electronics electromagnetic machines signal processing and industrial control and communications systems It also facilitates the use of intelligent systems such as neural networks fuzzy systems and evolutionary methods in terms of a hierarchical structure that makes factory control and supervision more efficient by addressing the needs of all production components Enhancing its value this fully updated collection presents research and global trends as published in the IEEE Transactions on Industrial Electronics Journal one of the largest and most respected publications in the field Fundamentals of Industrial Electronics covers the essential areas that form the basis for the field This volume presents the basic knowledge that can be applied to the other sections of the handbook Topics covered include Circuits and signals Devices Digital circuits Digital and analog signal processing Electromagnetics Other volumes in the set Power Electronics and Motor Drives Control and Mechatronics Industrial Communication Systems Intelligent Systems

Functional Verification of Programmable Embedded Architectures Prabhat Mishra, Nikil D. Dutt, 2005-12-06 It is widely acknowledged that the cost of validation and testing comprises a significant percentage of the overall development costs for electronic systems today and is expected to escalate sharply in the future Many studies have shown that up to 70% of the design development time and resources are spent on functional verification Functional errors manifest themselves very early in the design flow and unless they are detected up front they can result in severe consequence both financially and from a safety viewpoint Indeed several recent instances of high profile functional errors e.g the Pentium FDIV bug have resulted in increased attention paid to verifying the functional correctness of designs Recent efforts have proposed augmenting the traditional RTL simulation based validation methodology with formal techniques in an attempt to uncover hard to find corner cases with the goal of trying to reach RTL functional verification closure However what is often not highlighted is the fact that in spite of the tremendous time and effort put into such efforts at the RTL and lower levels of abstraction the complexity of contemporary embedded systems makes it difficult to guarantee functional correctness at the system level under all possible operational scenarios The problem is exacerbated in current System on Chip SOC design methodologies that employ Intellectual Property IP blocks composed of processor cores coprocessors and memory subsystems Functional verification becomes one of the major bottlenecks in the design of such systems
