ABSTRACT

In the context of the prolonged invasion of smooth cordgrass *Spartina alterniflora*, numerous native birds have progressively adapted to this invasive plant. Not only do certain non-specialist birds demonstrate an ability to inhabit and utilize smooth cordgrass, but a subset of specialist birds is also detected in the habitat as well. In this study, we provide evidence of the Slaty-breasted Rail *Lewinia striata* (Rallidae) occurring in smooth cordgrass, which had not been previously documented. These rails exhibit a significant reliance on the invaded vegetative community during their breeding season, engaging in foraging, vocalization, and even successful reproduction within the smooth cordgrass. The observations of Slaty-breasted Rail utilizing invasive smooth cordgrass highlight the possibility that, as natural wetlands continue to decline, birds that are highly dependent on marsh ecosystems may increasingly resort to the invasive *Spartina* community as a critical refuge. Such a transition is poised to impact their distribution, foraging, and reproduction. With the backdrop of large-scale removal of smooth cordgrass on the China coast, the disappearance of smooth cordgrass may harm the population of these birds. Further dedicated investigations and tracking of more individuals are needed to understand the specific ecological impact on Slaty-breasted Rail.

1 | Introduction

As globalization progresses, plant invasions caused by deliberate or unintentional introductions continue to increase worldwide (Gioria et al. 2023). Invasive plants are usually defined as non-native species that, when introduced to a new environment, have the potential to spread rapidly and cause harm to the ecosystem through various ways and threaten local biodiversity and habitat quality (Kumar and Prasad 2014). Numerous native species are driven toward extinction because of invasive plants (Bellard et al. 2016; Stewart et al. 2021). Therefore, plant invasion is considered one of the most common causes of biodiversity loss (Simberloff 2007). However, the impacts of invasive plants are not entirely negative, and the simplistic dichotomy of

categorizing native plants as beneficial and invasive plants as detrimental has been challenged (Goodenough 2010). Invasive species can also benefit native species through mechanisms such as habitat modification, competitive release, and predator release (Rodríguez 2006; Overton et al. 2014). To comprehend impacts and make decisions regarding conservation actions, it is crucial to understand and study how native species respond to invasive alien species (Humair et al. 2014; Pyšek et al. 2020).

Spartina alterniflora, commonly known as smooth cordgrass, is native to the eastern coast of North America and it was introduced by multiple countries in the last century as a flood control and soil erosion prevention plant for coastal areas (Ranwell and Downing 1960; Daehler and Strong 1996). Due
