**Geometric Probability** Herbert Solomon,1978-01-01 Topics include ways modern statistical procedures can yield estimates of  $\pi$  more precisely than the original Buffon procedure traditionally used the question of density and measure for random geometric elements that leave probability and expectation statements invariant under translation and rotation the number of random line intersections in a plane and their angles of intersection developments due to W L Stevens s ingenious solution for evaluating the probability that  $n$  random arcs of size  $a$  cover a unit circumference completely the development of M W Crofton s mean value theorem and its applications in classical problems and an interesting problem in geometrical probability presented by a karyograph

**Methods for Solving Systems of Nonlinear Equations** Werner C. Rheinboldt,1998-01-01 This volume discusses the ideas behind non linear equations as well as their theoretical foundations and properties

*Variational Methods for Eigenvalue Approximation* H. F. Weinberger,1974-01-01 Provides a common setting for various methods of bounding the eigenvalues of a self adjoint linear operator and emphasizes their relationships A mapping principle is presented to connect many of the methods The eigenvalue problems studied are linear and linearization is shown to give important information about nonlinear problems Linear vector spaces and their properties are used to uniformly describe the eigenvalue problems presented that involve matrices ordinary or partial differential operators and integro differential operators

**Random Number Generation and Quasi-Monte Carlo Methods** Harald Niederreiter,1992-01-01 This volume contains recent work in uniform pseudorandom number generation and quasi Monte Carlo methods and stresses the interplay between them

Probability Theory and Combinatorial Optimization J. Michael Steele,1997-01-01 An introduction to the state of the art of the probability theory most applicable to combinatorial optimization The questions that receive the most attention are those that deal with discrete optimization problems for points in Euclidean space such as the minimum spanning tree the traveling salesman tour and minimal length matchings

Numerical Analysis of Spectral Methods David Gottlieb,Steven A. Orszag,1977-01-01 A unified discussion of the formulation and analysis of special methods of mixed initial boundary value problems The focus is on the development of a new mathematical theory that explains why and how well spectral methods work Included are interesting extensions of the classical numerical analysis
