reproduction are an essential part of natural and agricultural ecosystems throughout North America. For example, most fruit, vegetable, and seed crops and some crops that provide fiber, drugs, and fuel depend on animals for pollination. This report provides evidence for the decline of some pollinator species in North America, including America's most important managed pollinator, the honey bee, as well as some butterflies, bats, and hummingbirds. For most managed and wild pollinator species, however, population trends have not been assessed because populations have not been monitored over time. In addition, for wild species with demonstrated declines, it is often difficult to determine the causes or consequences of their decline. This report outlines priorities for research and monitoring that are needed to improve information on the status of pollinators and establishes a framework for conservation and restoration of pollinator species and communities.

Farming and the Fate of Wild Nature Dan Imhoff, Jo Ann Baumgartner, 2006. *Farming and the Fate of Wild Nature* addresses an urgent and complex issue facing communities and cultures throughout the world: the need for heightened land stewardship and conservation in an era of diminishing natural resources. Agricultural lands in rural areas are being purchased for development. Water scarcities are pitting urban and development expansion against agriculture and conservation needs. The farming population is ageing and retiring, while those who remain struggle against low commodity prices, international competition, rising production costs, and the threat of disappearing subsidies. We are living amidst a major extinction crisis, much of it driven by agriculture as well as an increasing shift toward a global urban populace. The modern diet, driven by a grain-fed livestock industry, is no longer connected with the ecosystems that support it. In international circles, experts are arguing that further intensification of agriculture through industrialization and genetic modification will be necessary to both feed an exploding human population and to save what is left of wild biodiversity. This book takes up where its predecessor, the award-winning *Farming with the Wild*, left off. Featuring a wide range of in-depth essays, articles, and other materials by such authors as Aldo Leopold, Wendell Berry, Michael Pollan, Fred Kirschenmann, and Daniel Imhoff, this book persuasively demonstrates that farm and ranch operations which coexist with wild nature are necessary to sustain biodiversity and beauty on the landscape. In fact, as this invaluable educational resource demonstrates, they are essential in the challenge of building sane, healthy, and hopeful human societies.
